A guide to good oral hygiene

- Brush all tooth surfaces and gum margins twice a day with a fluoridated toothpaste.
- The mouth, like the rest of the body, needs a balanced diet so try to eat your five a day. Try to keep consumption of sugar-containing foods and drinks to meal times. Reduce the frequency of acidic and fizzy drinks. Can’t find time to brush after meals? Try some sugar free gum.
- Cleaning your tongue daily can help prevent bad breath and improve your sense of taste.
- Smoking damages all aspects of your health including your teeth and gums. Giving up smoking can be extremely difficult, ask your dental care professional for advice.

The tooth has five sides – do you clean them all?

With the toothbrush you clean the front, back and biting surface of the tooth. It is easy to forget that the tooth has two more sides – between the teeth. The most common oral diseases start between the teeth. By daily interdental cleaning, both gum disease and cavities can be successfully prevented.

What is interdental cleaning?

Interdental cleaning is the removal of plaque and impacted food from between the teeth, which your normal toothbrush cannot reach. Floss and interdental brushes are both good ways of removing plaque, although many people find interdental brushes easier to use. Whichever method is chosen, interdental cleaning should be carried out at least once daily. TePe Interdental Brushes are the most recommended brand by dental professionals and are available in nine colour-coded sizes.

Are interdental brushes safe to use?

The wires used in TePe’s Interdental brushes are plastic coated and safe to use on dental appliances, crowns, bridges and implants. The user-friendly handle and high quality filaments offer efficient cleaning.

How to use TePe Interdental brushes

Front of mouth: Insert the brush into the space between teeth at gum level, turning slightly (diag 1). This technique aids access and prolongs the life of the brush.

Once inserted, gently move the brush backwards and forwards a few times to remove plaque and debris (diag 2).

Back of mouth: The new TePe Angle™ brush, with its long handle and pre-angled head, is ideal for cleaning difficult-to-reach areas such as between the teeth at the back of the mouth. The TePe Angle can be used to clean from both the tongue and cheek sides. (diagrams 3 & 4).

Brush care: Always rinse brush in clean water during and after use.

How long do interdental brushes last?

We recommend you change the brush every week or when the bristles become worn or wires become buckled or distorted. Undue force and bending at severe angles will lead to damage of the wire.
